

**CELAGRAM(1)****CELAGRAM(1)****NAME**

celagram – Celera histogram viewer.

**SYNOPSIS**

celagram <datafile>

**DESCRIPTION**

*Celagram* reads from *datafile* the title for a histogram and a list of integer data values to be displayed in the histogram. This histogram window that comes up in response to the command line is identical in its operation to that in the *Celamy* program

**Data File Syntax:**

The first line of a celagram file should contain the title the user wishes placed in the window control bar. If the string is longer than 30 characters, only the first 30 characters are displayed. The remainder of the file should be a list of white-space separated integers. The integers do not need to be ordered. Celagram will sort them and produce a histogram of these values.
